CiteScore

CiteScore is calculated monthly based on Scopus citation data. CiteScore differs from other calculations in that it includes all types of documents (conference proceedings, letters etc.) rather than just research papers and reviews.

CiteScore = the number of times documents published in the previous 3 years have been cited in the year of reporting, divided by the number of documents.

Use CiteScore when you need an alternative to JIF, or you want to include a range of documents that are indexed in Scopus.
